

ABSTRACT

The present invention relates to glazing made of transparent laminated glass of at least two glass panes united by a transparent intercalating sheet of the thermoplastic type and an antisun coat which essentially reflects rays outside the visible spectrum of the solar rays, in particular infrared rays. The laminated glazing is characterized in that it is equipped, on the surface facing the driving compartment, with a transparent coat which essentially reflects heat rays, of the low-emissive type. Besides its antisun function, it also has an insulating function.
